			DATE MAILED: 04/26/2005		

Please find below and/or attached an Office communication concerning this application or proceeding.

		Application No.	Applicant(s)				
Office Action Summary		09/755,520	LUDWIG ET AL.				
		Examiner	Art Unit				
		Firmin Backer	3621				
	The MAILING DATE of this communication appears on the cover sheet with the correspondence address						
Period for Reply							
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filled after SIX (6) MONTHS from the mailing date of this communication. - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). - Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Art Unit: 3621

Response to Arguments

1. Applicant's arguments with respect to claims 1-36 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-36 are rejected under 35 U.S.C. 103(a) as being unpatentable over Rowney et al (U.S. Patent No. 5,996,076) in view of Sudia et al (U.S. PG Pub No. 2002/0029337 A1)
- 4. As per claims 1, 6, 11, 16, 27 and 32, Rowney et al teach a computerized method having a process flow operating over a computer network comprising a plurality of interconnected computers and a plurality of resources, each computer including a processor, memory and input/output devices, each resource operatively coupled to at least one of the computers and executing at least one of the activities in the process flow, the method comprising extracting verifiable role certificates from said electronic authorization; and verifying whether role certificates, associated with the authorization, are themselves authentic (see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34). Rowney et al fail to teach an inventive concept of an electronic representation of the transaction and at least one

Application/Control Number: 09/755,520

Art Unit: 3621

verifiable anonymous role certificate for each role for which approval is required to be completed to obtain authorization of the transaction and certificates generated for authentication completion. However, Sudia et al teach an inventive concept of an electronic representation of the transaction and at least one verifiable anonymous role certificate for each role for which approval is required to be completed to obtain authorization of the transaction and certificates generated for authentication completion (see abstract, paragraphs 0018, 0042, 0043, 0051, 0052, 0060). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the inventive concept of Rowney et al to include Sudia et al's electronic representation of the transaction and at least one verifiable anonymous role certificate for each role for which approval is required to be completed to obtain authorization of the transaction and certificates generated for authentication completion because this would have been desirable to use digital signature and certificate mechanisms to encode industry-wide security policy and authorization information into the signatures and certificates in order to permit the verifier of a signature to decide whether to accept the signature or certificate as valid, thus accommodating and easing electronic commerce business transactions.

Page 3

5. As per claims 2, 7, 12, 17, 28 and 33, Rowney et al teach a computerized method wherein roles associated with the role certificates are hashed and compared with hashed roles in a database of hashed roles (see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34).

Page 4

Art Unit: 3621

6. As per claims 3, 8, 13, 18, 29 and 34, Rowney et al teach a computerized method wherein the authorization is further insured by verifying that role certificates associated with the authorization correspond with roles in a permission set of roles of an authorization structure, the role certificates of which being required to authorize the transaction (see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34).

- 7. As per claims 4, 9, 14, 19, 30 and 35, Rowney et al teach a computerized method wherein the authorization structure is an authorization tree (see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34).
- 8. As per claims 5, 10, 15, 20, 31 and 36, Rowney et al teach a computerized method wherein the roles are extracted from the role certificates associated with the transaction, each extracted role being hashed and these hashed roles being concatenated and hashed again, and then concatenated with hashes of other permission sets, if any, according to the authorization structure and hashed once again, resulting in a computed hash value which may be compared to that which was signed by the Transaction Administrator, a match indicating that the transaction is authorized (see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34).
- 9. As per claims 21 and 24, Rowney et al teach a Transaction Authorization Method encoded on a computer readable medium, the method having the following steps receiving a request for a transaction, obtaining an electronic representation of a document having details of

Art Unit: 3621

the transaction from a Digital Document Database returning the transaction details to the requester awaiting and receiving from the requester the completed representation, signed by the requester requesting the Authorization Structure for the transaction from the Authorization Structure Database, the Authorization Structure being pre-signed with a signature by the Transaction Administrator and verifying the signature, and choosing a permission set of role names and user members of the permission set to contact to sign in these role names forwarding details of the transaction request with the signature of the requester to others having roles corresponding to the chosen permission set and collecting signatures of each role indicated in the permission set, requesting role certificates from the Role Certificate Database and signatures for each member of the permission set and encoding the same on the document; and forwarding the completed electronic document including the signatures and role certificates to the requester, the document including authorization details required in order to confirm the validity of the transaction (see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34). Rowney et al fail to teach an inventive concept of obtaining the role certificate signed with a signature by a Transaction Administrator from a Role Certificate Database and verifying the signature and certificates generated for authentication completion. However, Sudia et al teach an inventive concept of obtaining the role certificate signed with a signature by a Transaction Administrator from a Role Certificate Database and verifying the signature and certificates generated for authentication completion, (see abstract, paragraphs 0018, 0042, 0043, 0051, 0052, 0060). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the inventive concept of Rowney et al to include Sudia et al's electronic representation of obtaining the role certificate signed with a signature by a

Transaction Administrator from a Role Certificate Database and verifying the signature and certificates generated for authentication completion, because this would have been desirable to use digital signature and certificate mechanisms to encode industry-wide security policy and authorization information into the signatures and certificates in order to permit the verifier of a signature to decide whether to accept the signature or certificate as valid, thus accommodating and easing electronic commerce business transactions.

- As per claims 22 and 25, Rowney et al teach a Transaction Authorization Method wherein the role certificates and the Authorization Structure consist of hashed information about permission sets and roles, such hashed information substituting for the unhashed role certificates and permission sets (see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34).
- 11. As per claims 23 and 26, Rowney et al teach a Transaction Verification Method encoded on a computer readable medium, the method having the following, using a verification key of the Role Authority to check each certificate on the document, in the following manner, checking the signatures on the transaction details using the verification keys in the supplied role certificates extracting the named roles from the role certificates hashing the roles using a hash-of-hashes process, checking the computed hash value of the transaction against that was originally signed by the Transaction Authority to ensure that it is equal to the value for the transaction received in the Authorization Structure, using the output of the hash-of-hashes process as input to check the signature on the hash-of-hashes process; if the produced hash-of-hashes string matches the

Application/Control Number: 09/755,520

Art Unit: 3621

hashed string signed by the Transaction Authority, then assuming that the request is authorized; and reporting the result (see fig 1C, 4, 12A, 12B, 15B, 16, 26, 30, 35, column 15 lines 10-16 line 33, 17 lines 8-18 line 34). Rowney et al fail to teach an inventive concept of receiving an electronic document representing a transaction, associated transaction details being signed by a Transaction Authority, a collection of role certificates certifying named roles signed by a Role Authority, the transaction details signed by each of the signing keys corresponding to the verification keys in the role certificates, and the Authorization Structure and certificates generated for authentication completion. However, Sudia et al teach an inventive concept of receiving an electronic document representing a transaction, associated transaction details being signed by a Transaction Authority, a collection of role certificates certifying named roles signed by a Role Authority, the transaction details signed by each of the signing keys corresponding to the verification keys in the role certificates, and the Authorization Structure and certificates generated for authentication completion, (see abstract, paragraphs 0018, 0042, 0043, 0051, 0052, 0060). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the inventive concept of Rowney et al to include Sudia et al's receiving an electronic document representing a transaction, associated transaction details being signed by a Transaction Authority, a collection of role certificates certifying named roles signed by a Role Authority, the transaction details signed by each of the signing keys corresponding to the verification keys in the role certificates, and the Authorization Structure and certificates generated for authentication completion, because this would have been desirable to use digital signature and certificate mechanisms to encode industry-wide security policy and authorization information into the signatures and certificates in order to permit the verifier of a signature to

Art Unit: 3621

decide whether to accept the signature or certificate as valid, thus accommodating and easing

Page 8

electronic commerce business transactions.

Conclusion

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Firmin Backer whose telephone number is (703) 305-0624. The

examiner can normally be reached on Mon-Thu 9:00 AM - 5:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, James Trammell can be reached on (703) 305-9768. The fax phone number for the

organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR

system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
